Structural Order in Polymers: Lectures Presented at the International Symposium on Macromolecules, Florence, Italy, 7-12 September 1980 (IUPAC symposium series)

Structural Order in Polymers presents the increasing importance of the relationships between order in the chemical constitution and in the steric structure of the macromolecules and physical and chemical properties of the polymers. This book discusses the simple types of steric order found in biopolymers.

Organized into three parts encompassing 16 chapters, this book begins with an overview of the structural regularity as a primary requisite for the crystallization of a polymer. This text then examines the structure of cellulose, which is the most significant structural stereoregular polymer. Other chapters consider the major concepts of the stereoregulation of propylene catalytic polymerization. This book discusses as well the factors that determine microstructure and stereospecificity in polymerization. The final chapter deals with the significant role that membranes and membrane-related processes play in solving many ecological problems.

This book is a valuable resource for chemical engineers, chemists, physicists, scientists, and research workers.
